

Rule: „form type=“lemma” should be a copy of the existing form. BUT – it gets a different xml:id.

Below are the conditions and steps for the script, which sets “form type=”lemma”.

<b>Entry has ONE form:</b>	Steps ->	->	->	->	
1) Form has NO attribute “type”	Copy form	-	Set attribute type="lemma" for a copy	Insert copy (first)	-
2) Form has an attribute type="lemma"	Copy form	Delete attribute of a copy		Insert copy (second)	-
3) Form has an attribute type!="lemma"	Copy form	Delete attribute of a copy	Set attribute type="lemma" for a copy	Insert copy (first)	-
<b>Entry has MORE THAN ONE form:</b>					-
4) One form has an attribute type="lemma"	CORRECTED MANUALLY <sup>1</sup>				-
5) More than one form have an attribute type="lemma"	CORRECTED MANUALLY <sup>2</sup>				-
6) No form has an attribute type="lemma"	Copy 1 <sup>st</sup> form		Set attribute type="lemma" for a copy	Insert copy (first)	

<sup>1</sup> Checked if „form type=lemma“ **is always a copy of an existing form**. The problem with the script was that an additional, i.e. third, identical form was created in this case.

<sup>2</sup> Checked if „form type=lemma“ **is a copy of an existing form**. Removed „form type=lemma“ from one of the forms.
